

The computers rejecting your job application

A professional journalist, I had recently applied for a new job, and for the first part of the recruitment process the publisher made me play a number of simple online games from the comfort of my own home.

These included having to quickly count the number of dots in two boxes, inflating a balloon before it burst to win money, and matching emotions to facial expressions. Then an artificial intelligence (AI) software system assessed my personality, and either passed or failed me. No human had a look-in.

I wondered: is it fair for a computer alone to accept or reject your job application?

Welcome to the fast-growing world of AI recruitment.

While recruiters have been using AI for around the past decade, the technology has been greatly refined in recent years. And demand for it has risen strongly since the pandemic, thanks to its convenience and fast results at a time when staff may be off due to Covid-19.

The questions, and your answers to them, are designed to evaluate several aspects of a jobseeker's personality and intelligence, such as your risk tolerance and how quickly you respond to situations.

Its AI software is now used in the initial recruitment processes of a number of multinational companies, such as McDonald's, bank JP Morgan, accountancy firm PWC, and food group Kraft Heinz. An interview with a human recruiter then follows if you pass.

Welcome to the fast-growing world of AI recruitment.

While recruiters have been using AI for around the past decade, the technology has been greatly refined in recent years. And demand for it has risen strongly since the pandemic, thanks to its convenience and fast results at a time when staff may be off due to Covid-19.

The questions, and your answers to them, are designed to evaluate several aspects of a jobseeker's personality and intelligence, such as your risk tolerance and how quickly you respond to situations.

Its AI software is now used in the initial recruitment processes of a number of multinational companies, such as McDonald's, bank JP Morgan, accountancy firm PWC, and food group Kraft Heinz. An interview with a human recruiter then follows if you pass.

Task 1

Give a short account of the text in French in no more than 120 words (original text 239 words)

Task 2

You are an IT employee in a firm that is currently taking on new staff. Your CEO has asked you about the efficiency of AI recruiting tools. Respond by email giving the pros and cons.

The computers rejecting your job application

A professional journalist, I had recently applied for a new job, and for the first part of the recruitment process the publisher made me play a number of simple online games from the comfort of my own home.

These included having to quickly count the number of dots in two boxes, inflating a balloon before it burst to win money, and matching emotions to facial expressions. Then an artificial intelligence (AI) software system assessed my personality, and either passed or failed me. No human had a look-in.

I wondered: is it fair for a computer alone to accept or reject your job application?
